Profu De' Vin

Cristea Laur-Alexandru, Pop Patric, Iuonas Florin

In our project we developed an E-Commerce Website for a local wine store. The website is well structured and has a friendly interface. We also made it possible for a user to create an account and log in. All users need to be logged in to place an order.

On both wine and spirit pages we added filters to show only specific wines / spirits. Also, we added a search bar on both pages.

On the admin side, we created an Admin Dashboard where the admin can see the statistics from the last month. Also, the admin can see all the orders that were placed on the Orders Page. There he can see all the information about the orders and can change their status.

On wine and spirit pages, the admin can edit each wine and spirit to change their name, quantity available or price. Also, the admin can delete a wine / spirit from the database.

The user table from the database was created automatically by Django. There I created a group named Product Population. When a user is assigned to that group, he can Add wines or spirits to the database.

I, Cristea Alexandru, worked on the header and footer, wines page, signup page, profile page, admin dashboard, orders and cart page. Also, I developed the forgot password functionality along with the needed pages.

I, Pop Patric, worked on the spirits page, login page, statistics page and checkout page. The statistics page contains the statistics for the last 30 days. The login page sends a token to the database to check if a user exists with those credentials.

For the rest of the pages that are on the project, we worked together.
