Project name
DB lab project

Student A: Cristea Laur-Alexandru
Student B: Pop Patric

Techonologies: Django 3 with Python Web Development

Because of the fact that in our city just opened a new Wine Store called Profu' De Vin and we are affiliated with it, we decided that is a perfect opportunity to try and create the Web Site for that Store. We want to implement all the functionalities for this website, including being able to place an order online.

Student A
Login Page (full stack), Signup Page (full stack), Home (full stack) , Contact Page (This will only need Front End), Product Page (Front End).

Student B
Wines Page (full stack), Spirits Page (full stack), Cart Page (full stack)

Other specifications, if needed

For the add_to_cart functionality we both worked because we had some issues with that, so I can't specify who made that functionality. Also we want to implement in the future the Order Page with a full stack functionality, to be able to place an order from the website based on the items you have added to your Cart.
